

CS412/413

Introduction to Compilers and Translators Spring '00

Lecture 5: Bottom-up parsing

Outline

- More tips for LL(1) grammars
- Bottom-up parsing
- LR(0) parser construction

Lecture 5

CS 412/413 Spring '00 Andrew Myers

2

Administrivia

- Programming Assignment 1 due next class (Friday)
 - should be well under way -- leave time for testing, documentation
 - do not need to construct DFA!
- All group assignments should have settled out
- Homework 2 due next Friday
- Reading: finish Chapter 3 of Appel

Lecture 5

CS 412/413 Spring '00 Andrew Myers

3

Review

- Can make recursive descent parsers for LL(1) grammars

Lecture 5

CS 412/413 Spring '00 Andrew Myers

4

Grammars

- Have been using grammar for language of “sums with parentheses” $(1+(3+4))+5$
- Simple grammar w/ left associativity:
$$S \rightarrow S + E / E$$
$$E \rightarrow \text{number} \mid (S)$$
- LL(1) grammar for same language:
$$S \rightarrow ES'$$
$$S' \rightarrow \epsilon \mid + S$$
$$E \rightarrow \text{number} \mid (S)$$

Lecture 5

CS 412/413 Spring '00 Andrew Myers

5

Left vs. Right Recursion

Right recursion : right-associative

$$S \rightarrow ES' \quad S \rightarrow E + S$$
$$S' \rightarrow \epsilon \mid + S \quad S \rightarrow E$$

Left recursion : left-associative

$$S \rightarrow S + E$$
$$S \rightarrow E$$

Lecture 5

CS 412/413 Spring '00 Andrew Myers

6

$S \rightarrow S + E$
 $S \rightarrow E$

Left-recursive vs Right-recursive

- Left-recursive grammars don't work with top-down parsing: arbitrary amount of look-ahead needed

derived string	lookahead	read/unread
S	1	1 + 2 + 3 + 4
$S + E$	1	1 + 2 + 3 + 4
$S + E + E$	1	1 + 2 + 3 + 4
$S + E + E + E$	1	1 + 2 + 3 + 4
$E + E + E + E$	1	1 + 2 + 3 + 4
1 + $E + E + E$	2	1 + 2 + 3 + 4
1 + 2 + $E + E$	3	1 + 2 + 3 + 4
1 + 2 + 3 + E	4	1 + 2 + 3 + 4
1 + 2 + 3 + 4	S	1 + 2 + 3 + 4

Lecture 5 CS 412/413 Spring '00 Andrew Myers 7

How to create an LL(1) grammar

- Write a right-recursive grammar

$$S \rightarrow E + S$$

$$S \rightarrow E$$
- Left-factor common prefixes, place suffix in new non-terminal

$$S \rightarrow E S'$$

$$S' \rightarrow \epsilon$$

$$S' \rightarrow + S$$

Lecture 5 CS 412/413 Spring '00 Andrew Myers 8

EBNF

- Extended Backus-Naur Form: allows some regular expression syntax on RHS
 - *, +, (), ? operators (Iota spec: ? = [])
 - BNF: | operator at top level

$(1 + 2 + (3+4)) + 5$

$$S \rightarrow E S'$$

$$S' \rightarrow \epsilon \mid + S$$

$$S \rightarrow E (+ E)^*$$

- EBNF version: no position on + associativity

Lecture 5 CS 412/413 Spring '00 Andrew Myers 9

Top-down parsing EBNF

- Recursive-descent code can directly implement the EBNF grammar:

$$S \rightarrow E (+ E)^*$$

```

void parse_S () { // parses sequence of E + E + E ...
  parse_E ();
  while (true) {
    switch (token) {
      case '+': token = input.read(); parse_E(); break;
      case ')': case EOF: return;
      default: throw new ParseError();
    }
  }
}

```

Lecture 5 CS 412/413 Spring '00 Andrew Myers 10

Building a left-associative AST

```

Expr parse_S() {
  Expr result = parse_E();
  while (true) {
    switch (token) {
      case '+': token = input.read();
               result = new Add(result, parse_E());
               break;
      case ')': case EOF: return result;
      default: throw new ParseError();
    }
  }
}

```

Lecture 5 CS 412/413 Spring '00 Andrew Myers 11

Summary

- Now have complete recipe for building a parser

```

graph TD
  A[Language grammar] --> B[LL(1) grammar]
  B --> C[predictive parse table]
  C --> D[recursive-descent parser]
  D --> E[recursive-descent parser w/ AST generation]

```

Lecture 5 CS 412/413 Spring '00 Andrew Myers 12

Bottom-up parsing

- A more powerful parsing technology
- LR grammars -- more expressive than LL
 - can handle left-recursive grammars, virtually all programming languages
 - More natural expression of programming language syntax
- Shift-reduce parsers
 - automatic parser generators (e.g. yacc, CUP)
 - detect errors as soon as possible
 - allows better error recovery

Lecture 5

CS 412/413 Spring '00 Andrew Myers

13

Top-down parsing

$$(1+2+(3+4))+5$$

$$S \rightarrow S+E \rightarrow E+E \rightarrow (S)+E \rightarrow (S+E)+E \rightarrow (S+E+E)+E \rightarrow (1+E+E)+E \rightarrow (1+2+E)+E \dots$$

$$S \rightarrow S+E/E$$

$$E \rightarrow \text{number} | (S)$$

- In left-most derivation, entire tree above a token (2) has been expanded when encountered
- Must be able to predict productions!

Lecture 5

CS 412/413 Spring '00 Andrew Myers

14

Bottom-up parsing

- Right-most derivation -- backward
 - Start with the tokens
 - End with the start symbol

$$S \rightarrow S+E/E$$

$$E \rightarrow \text{number} | (S)$$

$$(1+2+(3+4))+5 \leftarrow (E+2+(3+4))+5 \leftarrow (S+2+(3+4))+5 \leftarrow (S+(3+4))+5 \leftarrow (S+(E+4))+5 \leftarrow (S+(S+4))+5 \leftarrow (S+(S+E))+5 \leftarrow (S+(S))+5 \leftarrow (S+E)+5 \leftarrow S$$

Lecture 5

CS 412/413 Spring '00 Andrew Myers

15

Progress of bottom-up parsing

Lecture 5

CS 412/413 Spring '00 Andrew Myers

16

Bottom-up parsing

- $(1+2+(3+4))+5$
 - $\leftarrow (E+2+(3+4))+5$
 - $\leftarrow (S+2+(3+4))+5$
 - $\leftarrow (S+E+(3+4))+5 \dots$
- Advantage of bottom-up parsing: can select productions based on more information

$$S \rightarrow S+E/E$$

$$E \rightarrow \text{number} | (S)$$

Lecture 5

CS 412/413 Spring '00 Andrew Myers

17

Top-down vs. Bottom-up

Bottom-up: Don't need to figure out as much of the parse tree for a given amount of input

Lecture 5

CS 412/413 Spring '00 Andrew Myers

18

Shift-reduce parsing

- Parsing is a sequence of *shift* and *reduce* operations
- Parser state is a stack of terminals and non-terminals (grows to the right)
- Unconsumed input is a string of terminals
- Current derivation step is always stack+input

Derivation step	stack	unconsumed input
$(1+2+(3+4))+5 \leftarrow$		$(1+2+(3+4))+5$
$(E+2+(3+4))+5 \leftarrow$	(E	$+2+(3+4))+5$
$(S+2+(3+4))+5 \leftarrow$	(S	$+2+(3+4))+5$
$(S+E+(3+4))+5 \leftarrow$	(S+E	$+(3+4))+5$

Lecture 5

CS 412/413 Spring '00 Andrew Myers

19

Shift-reduce parsing

- Parsing is a sequence of *shifts* and *reduces*
- **Shift** -- move look-ahead token to stack

stack	input	action
($1+2+(3+4))+5$	<i>shift</i> 1
(1	$+2+(3+4))+5$	

- **Reduce** -- Replace symbols γ in top of stack with non-terminal symbol X , corresponding to production $X \rightarrow \gamma$ (pop γ , push X)

stack	input	action
(S+E	$+(3+4))+5$	<i>reduce</i> $S \rightarrow S+E$
(S	$+(3+4))+5$	

Lecture 5

CS 412/413 Spring '00 Andrew Myers

20

Shift-reduce parsing

$S \rightarrow S + E / E$
 $E \rightarrow \text{number} | (S)$

derivation	stack	input stream	action
$(1+2+(3+4))+5 \leftarrow$		$(1+2+(3+4))+5$	<i>shift</i>
$(1+2+(3+4))+5 \leftarrow$	($1+2+(3+4))+5$	<i>shift</i>
$(1+2+(3+4))+5 \leftarrow$	(1	$+2+(3+4))+5$	<i>reduce</i> $E \rightarrow \text{num}$
$(E+2+(3+4))+5 \leftarrow$	(E	$+2+(3+4))+5$	<i>reduce</i> $S \rightarrow E$
$(S+2+(3+4))+5 \leftarrow$	(S	$+2+(3+4))+5$	<i>shift</i>
$(S+2+(3+4))+5 \leftarrow$	(S+	$2+(3+4))+5$	<i>shift</i>
$(S+2+(3+4))+5 \leftarrow$	(S+2	$+(3+4))+5$	<i>reduce</i> $E \rightarrow \text{num}$
$(S+E+(3+4))+5 \leftarrow$	(S+E	$+(3+4))+5$	<i>reduce</i> $S \rightarrow S+E$
$(S+(3+4))+5 \leftarrow$	(S	$+(3+4))+5$	<i>shift</i>
$(S+(3+4))+5 \leftarrow$	(S+	$(3+4))+5$	<i>shift</i>
$(S+(3+4))+5 \leftarrow$	(S+($3+4))+5$	<i>shift</i>
$(S+(3+4))+5 \leftarrow$	(S+(3	$+4))+5$	<i>reduce</i> $E \rightarrow \text{num}$

Lecture 5

CS 412/413 Spring '00 Andrew Myers

21

Problem

- How do we know which action to take -- whether to shift or reduce, and which production?
- Sometimes can reduce but shouldn't
 – e.g., $X \rightarrow \epsilon$ can *always* be reduced
- Sometimes can reduce in different ways

Lecture 5

CS 412/413 Spring '00 Andrew Myers

22

Action Selection Problem

- Given stack σ and look-ahead symbol b , should we
 - **shift** b onto the stack (making it σb)
 - **reduce** some production $X \rightarrow \gamma$ assuming that stack has the form $\alpha \gamma$ (making it αX)
- If stack has form $\alpha \gamma$, should apply reduction $X \rightarrow \gamma$ depending on what stack prefix α is -- but α is different for different possible reductions, since γ 's have different length. How to keep track?

Lecture 5

CS 412/413 Spring '00 Andrew Myers

23

Parser States

- Goal: know what reductions are legal at any given point
- Idea: summarize all possible stack prefixes α as a parser *state*
- Parser state is defined by a DFA that reads in the stack α
- Accept states of DFA: unique reduction!
- Summarizing discards information
 - affects what grammars parser handles
 - affects size of DFA (number of states)

Lecture 5

CS 412/413 Spring '00 Andrew Myers

24

LR(0) parser

- Left-to-right scanning, Right-most derivation, “zero” look-ahead characters
- Too weak to handle most language grammars (including this one)
- But will help us understand how to build better parsers

Lecture 5

CS 412/413 Spring '00 Andrew Myers

25

An LR(0) grammar: non-empty lists

$$S \rightarrow (L)$$

$$S \rightarrow id$$

$$L \rightarrow S$$

$$L \rightarrow L , S$$

x (x,y) (x, (y,z), w)
 (((x))) (x, (y, (z, w)))

Lecture 5

CS 412/413 Spring '00 Andrew Myers

26

LR(0) states

- A state is a set of items
- An LR(0) item is a production from the language with a separator “.” somewhere in the RHS of the production

- Stuff before “.” already on stack (beginnings of possible γ 's to be reduced)
- Stuff after “.”: what we might see next
- The prefixes α represented by state itself

Lecture 5

CS 412/413 Spring '00 Andrew Myers

27

Start State & Closure

$$S \rightarrow (L) \mid id$$

$$L \rightarrow S \mid L , S$$

- First step: augment grammar with prod'n $S' \rightarrow S \$$
- Start state of DFA: empty stack = $S' \rightarrow . S \$$
- **Closure** of a state adds items for all productions whose LHS occurs in an item in the state, just after “.”
 - set of possible productions to be reduced next
 - Added items have the “.” located at the beginning: no symbols for these items on the stack yet

Lecture 5

CS 412/413 Spring '00 Andrew Myers

28

Applying symbols

In new state, include all items that have appropriate input symbol just after dot, and advance dot in those items (and take closure.)

Lecture 5

CS 412/413 Spring '00 Andrew Myers

29

Applying reduce actions

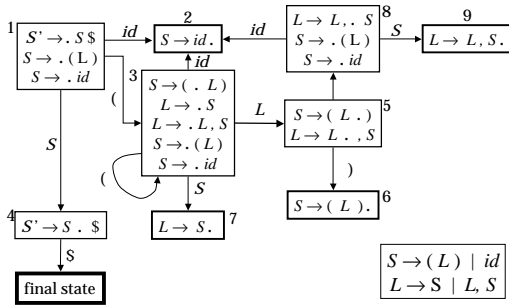

- Pop RHS off stack, replace with LHS X ($X \rightarrow \gamma$), rerun DFA (e.g. (x))

Lecture 5

CS 412/413 Spring '00 Andrew Myers

30

Full DFA (Appel p. 63)

Lecture 5

CS 412/413 Spring '00 Andrew Myers

31

- Optimization: stack is labeled w/state
- Let's try parsing ((x),y)

derivation	stack	input	action
$((x),y) \leftarrow$	1	$((x),y)$	shift, goto 3
$((x),y) \leftarrow$	1 (3	$(x),y)$	shift, goto 3
$((x),y) \leftarrow$	1 (3 (3	$x),y)$	shift, goto 2
$((x),y) \leftarrow$	1 (3 (3 x_2),y)		reduce $S \rightarrow id$
$((S),y) \leftarrow$	1 (3 (3 S_7),y)		reduce $L \rightarrow S$
$((L),y) \leftarrow$	1 (3 (3 L_5),y)	$),y)$	shift, goto 6
$((L),y) \leftarrow$	1 (3 (3 L_5) ₆	$.y)$	reduce $S \rightarrow (L)$
$((S),y) \leftarrow$	1 (3 S_7	$.y)$	reduce $L \rightarrow S$
$((L),y) \leftarrow$	1 (3 L_5	$.y)$	shift, goto 8
$((L),y) \leftarrow$	1 (3 $L_5, 8$	$y)$	shift, goto 9
$((L),y) \leftarrow$	1 (3 $L_5, 8, y_2$	$)$	reduce $S \rightarrow id$
$((L),S) \leftarrow$	1 (3 $L_5, 8, S_9$	$)$	reduce $L \rightarrow L, S$
$((L) \leftarrow$	1 (3 L_5	$)$	shift, goto 6
$((L) \leftarrow$	1 (3 L_5) ₆		reduce $S \rightarrow (L)$
S	1 S_4	S	done

Lecture 5

CS 412/413 Spring '00 Andrew Myers

32

Bottom-up parsing

- Grammars can be parsed bottom-up using a DFA + stack
- State construction converts grammar into states that capture information needed to know what action to take
- *Next time*: shift-reduce parsing tables
SLR, LR(1) parsers, automatic parser generators

Lecture 5

CS 412/413 Spring '00 Andrew Myers

33
