

# Lecture 10: Lists and Sequences

(Sections 10.0-10.2, 10.4-10.6, 10.8-10.13)

CS 1110  
Introduction to Computing Using Python

[E. Andersen, A. Bracy, D. Fan, D. Gries, L. Lee,  
S. Marschner, C. Van Loan, W. White]

## Sequences: Lists of Values

### String

- `s = 'abc d'`

0	1	2	3	4
a	b	c		d
- Put characters in quotes
  - Use `\` for quote character
- Access characters with `[]`
  - `s[0]` is 'a'
  - `s[5]` causes an error
  - `s[0:2]` is 'ab' (excludes c)
  - `s[2:]` is 'c d'
- `len(s)` → 5, length of string

### List

- `x = [5, 6, 5, 9, 15, 23]`

0	1	2	3	4	5
5	6	5	9	15	23
- Put values inside `[]`
  - Separate by commas
- Access **values** with `[]`
  - `x[0]` is 5
  - `x[6]` causes an error
  - `x[0:2]` is [5, 6] (excludes 2nd 5)
  - `x[3:]` is [9, 15, 23]
- `len(x)` → 6, length of list

Sequence is a name we give to both

5

## Announcements

- Only if** you cannot write Prelim 1 in person on Mar 30 at 6:30pm Ithaca time or have SDS exam accommodations, do the CMS "assignment" called "Prelim 1 alternate format/time request" (both Parts A & B). Request deadline is Mar 16 11:59pm. **Tonight**
- Legitimate reasons needed to request online format and/or alternative time
  - Conflicting exam listed on University Evening Prelim Schedule
  - You are not in Ithaca
- "Go to" lab weekly!! Stay on track. Great student:staff ratio!
- A2 due Mar 19 at 11:59pm
- Window to submit A1 revisions closes Mar 20 at 11:59pm

## Lists Have Methods Similar to String

`x = [5, 6, 5, 9, 15, 23]`

- `<list>.index(<value>)`
  - Return position of the value
  - ERROR** if value is not there
  - `x.index(9)` evaluates to 3
- `<list>.count(<value>)`
  - Returns number of times value appears in list
  - `x.count(5)` evaluates to 2

But to get the length of a list you use a function, not a class method:

`len(x)`  
`x.len()`

6

## Representing Lists

**Wrong:**

Global Space

~~`x = [5, 6, 7, -2]`~~

**Correct:**

Global Space

`x = id1`

Heap Space

id1	list
0	5
1	7
2	4
3	-2

Indices

`x = [5, 7, 4, -2]`

8

## Lists vs. Class Objects

**List**

- Attributes are indexed
  - Example: `x[2]`

Global Space

`x = id2`

Heap Space

id2	list
0	5
1	7
2	4
3	-2

**Objects**

- Attributes are named
  - Example: `p.x`

Global Space

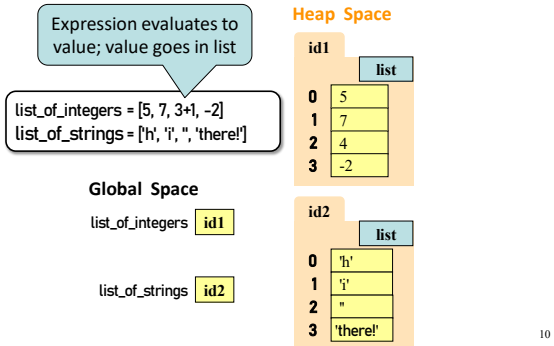

`p = id3`

Heap Space

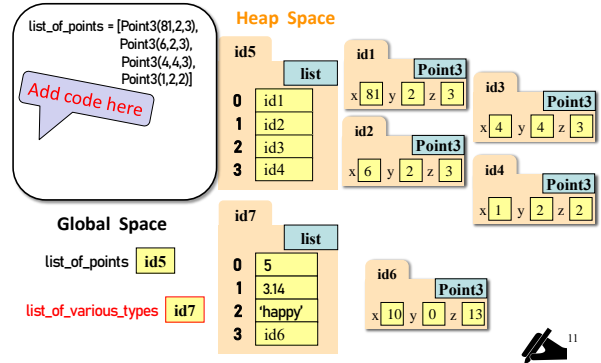

id3	Point3
x	1
y	2
z	3

9

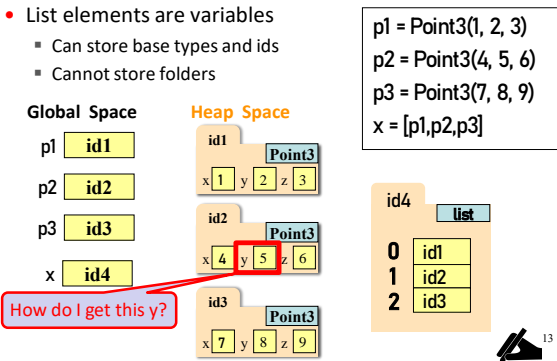

## Lists Can Hold Any Type

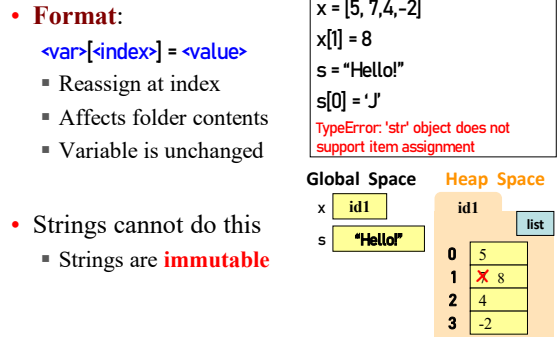

## No Really, Lists Can Hold Any Type!

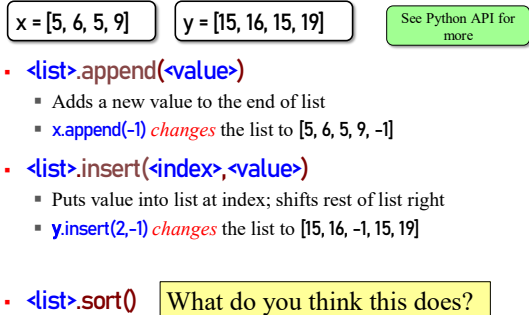

## Lists of Objects

## List is mutable; strings are not

## List Methods Can Alter the List

## Q1: Insert into list

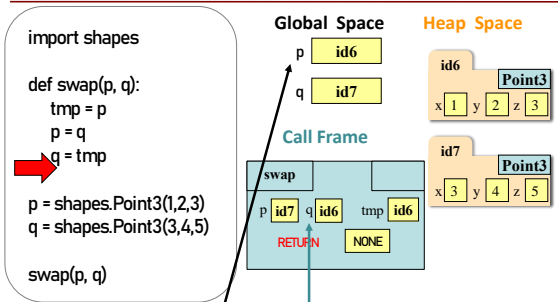

- Execute the following:
 

```
>>> x = [5, 6, 5, 9, 10]
>>> x[3] = -1
>>> x.insert(1, 2)
```
- What is `x[4]`?

```
A: 10
B: 9
C: -1
D: ERROR
E: I don't know
```

17

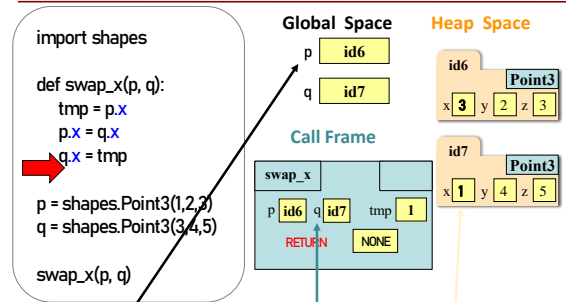

## Recall: identifier assignment → no swap

At the end of `swap`: parameters `p` and `q` are swapped  
global `p` and `q` are unchanged

19

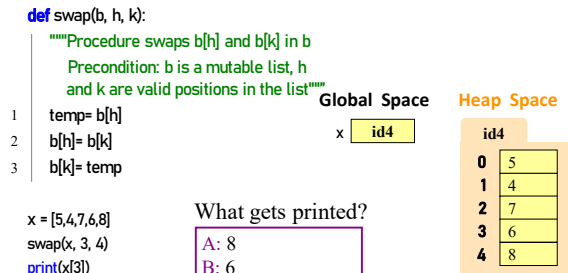

## Recall: Attribute Assignment → swap!

At the end of `swap`: parameters `p` and `q` are unchanged  
global `p` and `q` are unchanged, attributes `x` are swapped

20

## Q2: Swap List Values?

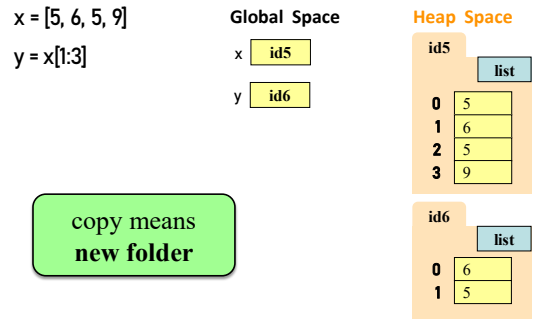

What gets printed?

- A: 8
- B: 6
- C: Something else
- D: I don't know

21

## List Slices Make Copies: a slice of a list is a new list

27

## Q3: List Slicing

- Execute the following:
 

```

>>> x = [5, 6, 5, 9, 10]
>>> y = x[1:]
>>> y[0] = 7
            
```
- What is `x[1]`?

- A: 7
- B: 5
- C: 6
- D: **ERROR**
- E: I don't know

28

## Q4

- Execute the following:
 

```

>>> x = [5, 6, 5, 9, 10]
>>> y = x
>>> y[1] = 7
            
```
- What is `x[1]`?

- A: 7
- B: 5
- C: 6
- D: **ERROR**
- E: I don't know

30

## Things that Work for All Sequences

<code>s = 'slithy'</code>	<code>x = [5, 6, 9, 6, 15, 5]</code>
<code>s.index('s') → 0</code> <code>s.count('t') → 1</code> <code>len(s) → 6</code> <code>s[4] → "h"</code> <code>s[1:3] → "li"</code> <code>s[3:] → "thy"</code> <code>s[-2] → "h"</code> <code>s + ' toves' → "slithy toves"</code> <code>s * 2 → "slithyslithy"</code> <code>'t' in s → True</code>	<code>x.index(5) → 0</code> <code>x.count(6) → 2</code> <code>len(x) → 6</code> <code>x[4] → 15</code> <code>x[1:3] → [6, 9]</code> <code>x[3:] → [6, 15, 5]</code> <code>x[-2] → 15</code> <code>x + [1, 2] → [5, 6, 9, 6, 15, 5, 1, 2]</code> <code>x * 2 → [5, 6, 9, 6, 15, 5, 5, 6, 9, 6, 15, 5]</code> <code>15 in x → True</code>
<div style="border: 1px solid black; padding: 2px; width: fit-content;">methods</div> <div style="border: 1px solid black; padding: 2px; width: fit-content;">built-in fns</div> <div style="border: 1px solid black; padding: 2px; width: fit-content;">slicing</div> <div style="border: 1px solid black; padding: 2px; width: fit-content;">operators</div>	

35

## Lists and Strings Go Hand in Hand

`text.split(<sep>)`: return a list of words in `text` (separated by `<sep>`, or whitespace by default)

`<sep>.join(words)`: concatenate the items in the list of strings `words`, separated by `<sep>`.

```
>>> text = 'A sentence is just\n a list of words'
```

```
>>> words = text.split()
```

```
>>> words
```

Turns string into a list of words

```
['A', 'sentence', 'is', 'just', 'a', 'list', 'of', 'words']
```

```
>>> lines = text.split("\n")
```

```
>>> lines
```

Turns string into a list of lines

```
['A sentence is just', ' a list of words']
```

```
>>> hyphenated = '-'.join(words)
```

```
>>> hyphenated
```

Combines elements with hyphens

```
'A-sentence-is-just-a-list-of-words'
```

```
>>> hyphenated2 = '-'.join(lines[0].split()+lines[1].split())
```

```
>>> hyphenated2
```

Merges 2 lists, combines elements with hyphens

```
'A-sentence-is-just-a-list-of-words'
```

## Tuples (see lesson video)

strings: immutable sequences of characters	tuples*: immutable sequences of any objects	lists: mutable sequences of any objects
--	---	---

\* "tuple" generalizes "pair," "triple," "quadruple," ...

- Tuples fall between strings and lists
  - write them with just commas: `42`, `4.0`, `'x'`
  - often enclosed in parentheses: `(42, 4.0, 'x')`

Use **lists** for:

- long sequences
- homogeneous sequences
- variable length sequences

Use **tuples** for:

- short sequences
- heterogeneous sequences
- fixed length sequences
