# Lecture 15: **Recursion**

(Sections 5.8-5.10)

CS 1110

Introduction to Computing Using Python

[E. Andersen, A. Bracy, D. Fan, D. Gries, L. Lee,  
S. Marschner, C. Van Loan, W. White]

# Announcements

---

- Assignment 2 regrade request due Friday
- New topic today—recursion—takes time to learn
  - Post-lecture activities
  - Next lab to be released a little earlier than usual so that you can think about it and **ask questions during lab**. Not earlier due date—just more time to think

# Recursion

---

- Not new python, but a new way of organizing thinking/algorithm
- Important in CS—CS majors will see it in action all 4 years
- Introduction only in CS1110, over 2 lectures
  1. Intro, examples, “divide & conquer”
  2. Visualization, different ways to “divide”, + objects
- Hard work on understanding call frames and the call stack will now pay off!

# Recursion

---

## Recursive Function:

A function that calls *itself*

## An example in mathematics: factorial

- Non-recursive definition:

$$n! = n \times \underbrace{n-1 \times \dots \times 2 \times 1}_{(n-1)!}$$

- Recursive definition:

$$n! = n (n-1)!$$

$$0! = 1$$

Details in pre-  
lecture videos

# Recursion

---

## Recursive Function:

A function that calls *itself*

## Two parts to every recursive function:

1. A simple case: can be solved easily
2. A complex case: can be made simpler (and simpler, and simpler... until it looks like the simple case)

**Think about opening a set of Russian dolls as a “problem.” Which is the simpler case,**

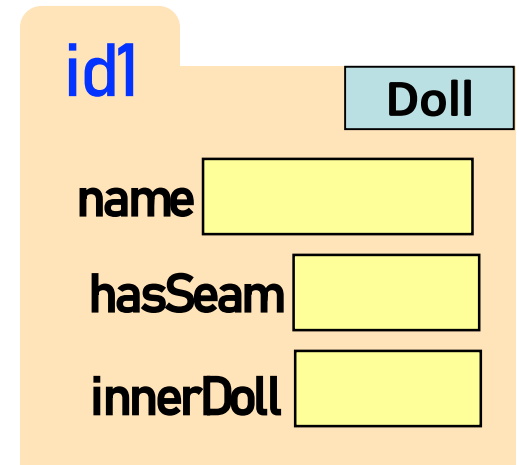

the case where the doll has a seam and another doll inside of it, or

the case where the doll has no seam and no doll inside of it?

# Russian Dolls!

`import russian`

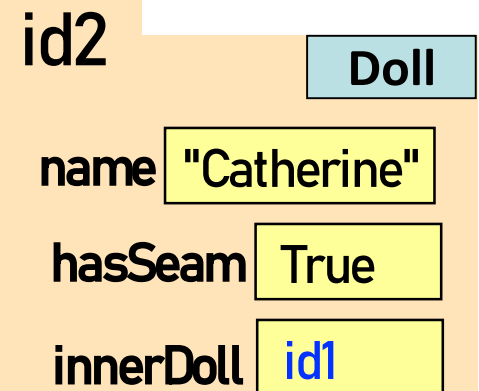

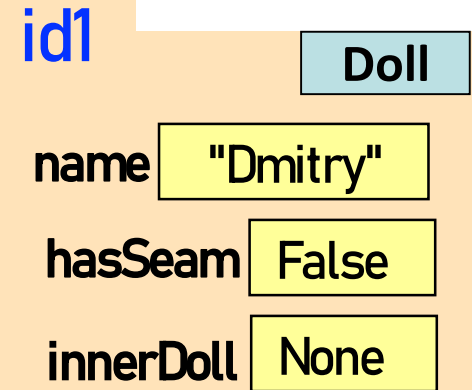

# Russian Dolls!

Global Space

Heap Space

```
import russian
```

```
d1 = russian.Doll("Dmitry", None)
```

```
d2 = russian.Doll("Catherine", d1)
```

```
def open_doll(d):
```

```
    """Input: a Russian Doll
```

```
    Opens the Russian Doll d """
```

```
    print("My name is "+ d.name)
```

```
    if d.hasSeam:
```

```
        inner = d.innerDoll
```

```
        open_doll(inner)
```

```
    else:
```

```
        print("That's it!")
```

# Play with the code

---

- Download modules [russian.py](#), [playWithDolls.py](#)
- Read [playWithDolls.py](#); then run it as a script.
- Modify last statement and run script again:
  - `open_doll(d3)`
- Modify last statement again and run script again :
  - `open_doll(d1)`
- Do you understand the result?
- Use Python Tutor to visualize (more next lecture)

# Recursion: Examples

---

- Russian Dolls
- **Blast Off!**
- Factorial
- Count number of 'e's
- Deblank – removing spaces from a string

# Blast Off!

---

**blast\_off(5)** # must be a non-negative int

5

4

3

2

1

BLAST OFF!

**What is the simple case  
that can be solved easily?**

- positive  $n > 1$
- $n$  is 1
- $n$  is 0

**blast\_off(0)**

BLAST OFF!

# Blast Off!

---

```
def blast_off(n):
```

```
    """Input: a non-negative int
```

```
    Counts down from n to Blast-Off!
```

```
    """
```

# A Mathematical Example: Factorial

---

- Non-recursive definition:

$$\begin{aligned}n! &= n \times n-1 \times \dots \times 2 \times 1 \\ &= n (n-1 \times \dots \times 2 \times 1)\end{aligned}$$

- Recursive definition:

$$n! = n (n-1)! \quad \text{for } n > 0 \quad \text{Recursive case}$$

$$0! = 1 \quad \text{Base case}$$

Details in pre-  
lecture videos

# Factorial as a Recursive Function

```
def factorial(n):
```

```
    """Returns: factorial of n.
```

```
    Pre: n ≥ 0 an int"""
```

```
    if n == 0:
```

```
        return 1
```

```
    return n*factorial(n-1)
```

- $n! = n (n-1)!$

- $0! = 1$

**Base case(s)**

**Recursive case**

What happens if there is no base case?

# Recursion vs Iteration

---

- **Recursion** is *provably equivalent* to **iteration**
  - Iteration includes **for-loop** and **while-loop** (later)
  - Anything can do in one, can do in the other
- But some things are easier with recursion
  - And some things are easier with iteration
- Will **not** teach you when to choose recursion
  - That's for upper level courses
- We just want you to *understand the technique*

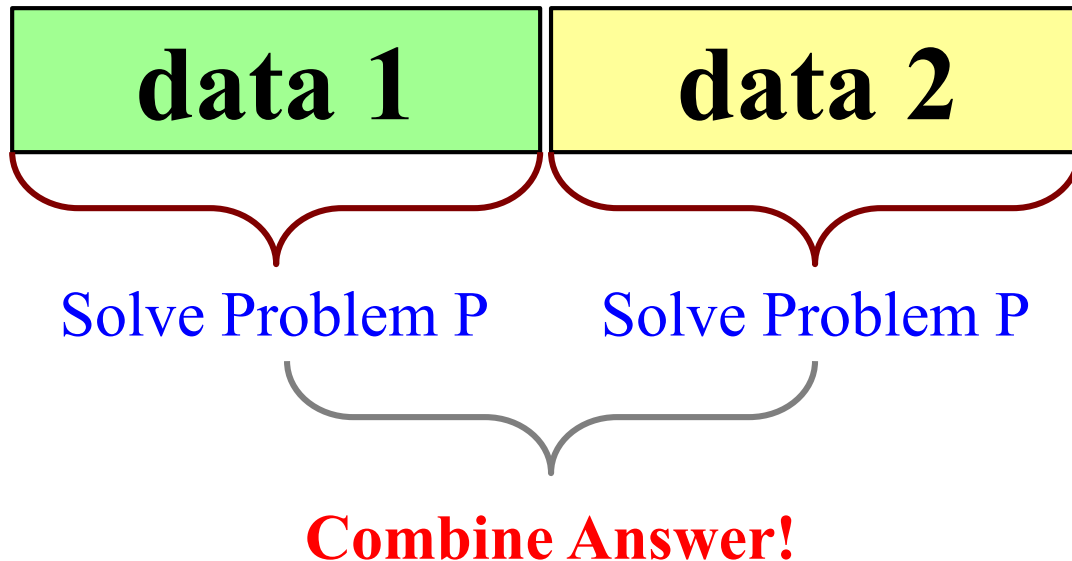

# Recursion is great for **Divide and Conquer**

---

**Goal:** Solve problem P on a piece of data

**Idea:** Split data into two parts and solve problem

# Divide and Conquer Example

---

Count the number of 'e's in a string:

Two 'e's

One 'e'

One 'e'

# Divide and Conquer Example

---

Count the number of 'e's in a string:

Two 'e's

Zero 'e's

Two 'e's

# Divide and Conquer

---

**Goal:** Solve really big problem P

**Idea:** Split into simpler problems, solve, combine

## 3 Steps:

1. Decide what to do for simple cases
2. Decide how to break up the task
3. Decide how to combine your work

# Three Steps for Divide and Conquer

---

1. Decide what to do on “small” data
  - Some data cannot be broken up
  - Have to compute this answer directly
2. Decide how to break up your data
  - Both “halves” should be smaller than whole
  - Often no wrong way to do this (next lecture)
3. Decide how to combine your answers
  - Assume the smaller answers are correct
  - Combine them to give the aggregate answer

# Divide and Conquer Example

---

```
def num_es(s):
```

```
    """Returns: # of 'e's in s"""
```

```
    # 1. Handle small data
```

```
    # 2. Break into two parts
```

```
    # 3. Combine the result
```

# Divide and Conquer Example

```
def num_es(s):  
    """Returns: # of 'e's in s"""  
    # 1. Handle small data  
    if s == "":  
        | return 0  
    elif len(s) == 1:  
        | return 1 if s[0] == 'e' else 0
```

```
“Short-cut” for  
    if s[0] == 'e':  
        return 1  
    else:  
        return 0
```

```
# 2. Break into two parts
```

```
left = num_es(s[0])
```

```
right = num_es(s[1:])
```

```
# 3. Combine the result
```

```
return left+right
```

# Divide and Conquer Example

```
def num_es(s):
```

```
    """Returns: # of 'e's in s"""
```

```
    # 1. Handle small data
```

```
    if s == "":
```

```
        | return 0
```

```
    elif len(s) == 1:
```

```
        | return 1 if s[0] == 'e' else 0
```

```
    # 2. Break into two parts
```

```
    left = num_es(s[0])
```

```
    right = num_es(s[1:])
```

```
    # 3. Combine the result
```

```
    return left+right
```

# Divide and Conquer Example

```
def num_es(s):  
    """Returns: # of 'e's in s"""  
    # 1. Handle small data  
    if s == "":  
        | return 0  
    elif len(s) == 1:  
        | return 1 if s[0] == 'e' else 0  
  
    # 2. Break into two parts  
    left = num_es(s[0])  
    right = num_es(s[1:])  
  
    # 3. Combine the result  
    return left+right
```

# Divide and Conquer Example

```
def num_es(s):
```

```
    """Returns: # of 'e's in s"""
```

```
    # 1. Handle small data
```

```
    if s == "":
```

```
        | return 0
```

```
    elif len(s) == 1:
```

```
        | return 1 if s[0] == 'e' else 0
```

Base Case

```
    # 2. Break into two parts
```

```
    left = num_es(s[0])
```

```
    right = num_es(s[1:])
```

Recursive  
Case

```
    # 3. Combine the result
```

```
    return left+right
```

# Exercise: Remove Blanks from a String

---

```
def deblank(s):
```

```
    """Returns: s but with its blanks removed"""
```

## 1. Decide what to do on “small” data

- If it is the **empty string**, nothing to do

```
if s == "":  
    | return s
```

- If it is a **single character**, delete it if a blank

```
if s == ' ': # There is a space here  
    | return "" # Empty string  
else:  
    | return s
```

# Exercise: Remove Blanks from a String

---

```
def deblank(s):
```

```
    """Returns: s but with its blanks removed"""
```

## 2. Decide how to break it up

```
    left = deblank(s[0])    # A string with no blanks
```

```
    right = deblank(s[1:]) # A string with no blanks
```

## 3. Decide how to combine the answers

```
    return left+right      # String concatenation
```

# Putting it All Together

```
def deblank(s):
```

```
    """Returns: s w/o blanks"""
```

```
    if s == ":
```

```
        | return s
```

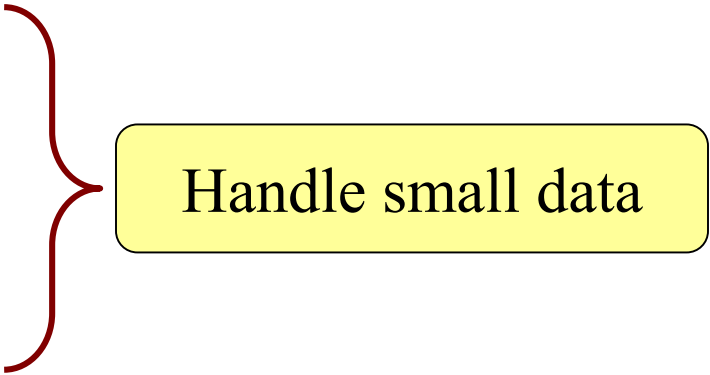

```
    elif len(s) == 1:
```

```
        | return " if s[0] == ' ' else s
```

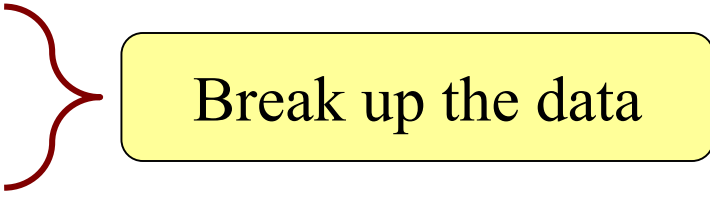

```
    left = deblank(s[0])
```

```
    right = deblank(s[1:])
```

```
    return left+right
```

Handle small data

Break up the data

Combine answers

# Putting it All Together

---

```
def deblank(s):
```

```
    """Returns: s w/o blanks"""
```

```
    if s == ":
```

```
        | return s
```

```
    elif len(s) == 1:
```

```
        | return " if s[0] == ' ' else s
```

```
    left = deblank(s[0])
```

```
    right = deblank(s[1:])
```

```
    return left+right
```

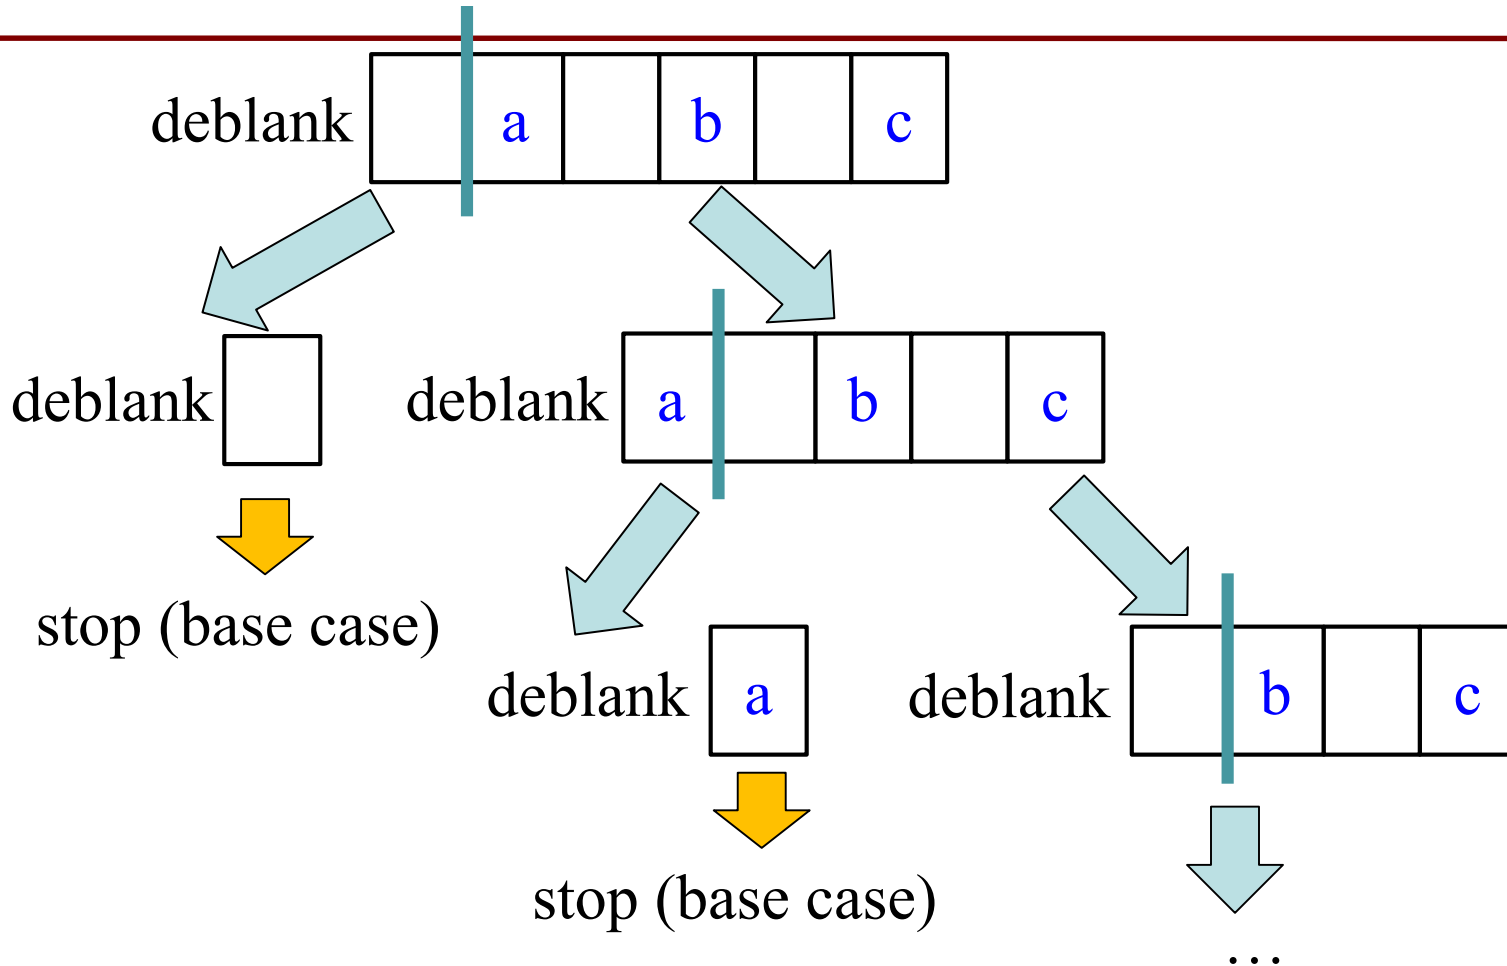

Base Case

Recursive Case

# Following the Recursion

You really, really, really want to **visualize a call of `deblank` using Python Tutor**. Pay attention to the recursive calls (call frames opening up), the completion of a call (sending the result to the call frame "above"), and the resulting accumulation of the answer.

# Post-lecture exercise

---

- Visualize a call of `deblank` using Python Tutor
- Code in file `deblank.py`
- Pay attention to
  - the recursive calls (call frames opening up),
  - the completion of a call (sending the result to the call frame “above”),
  - and the resulting accumulation of the answer.
- Do this exercise before next lecture. *Really!*
