Introduction to Compilers  
Radu Rugina

Lecture 6: Top-Down Parsing  
06 Feb 04

## Outline

- More on writing CFGs
- Top-down parsing
- LL(1) grammars
- Transforming a grammar into LL form
- Recursive-descent parsing

## Where We Are

## Review of CFGs

- Context-free grammars can describe programming-language syntax
- Power of CFG needed to handle common PL constructs (e.g., parens)
- String is in language of a grammar if derivation from start symbol to string
- Ambiguous grammars a problem

## if-then-else

- How to write a grammar for if stmts?

$S \rightarrow \text{if } (E) S$   
 $S \rightarrow \text{if } (E) S \text{ else } S$   
 $S \rightarrow \text{other}$

Is this grammar ok?

## No—Ambiguous!

- How to parse?

$\text{if } (E_1) \text{ if } (E_2) S_1 \text{ else } S_2$

$S \rightarrow \text{if } (E) S$   
 $S \rightarrow \text{if } (E) S \text{ else } S$   
 $S \rightarrow \text{other}$

$S \rightarrow \text{if } (E) S$   
 $\rightarrow \text{if } (E) \text{ if } (E) S \text{ else } S$

$S \rightarrow \text{if } (E) S \text{ else } S$   
 $\rightarrow \text{if } (E) \text{ if } (E) S \text{ else } S$

Which "if" is the "else" attached to?

## Grammar for Closest-if Rule

- Want to rule out `if (E) if (E) S else S`
- Impose that unmatched "if" statements occur only on the "else" clauses

```
statement → matched | unmatched
matched  → if (E) matched else matched
          | other
unmatched → if (E) statement
          | if (E) matched else unmatched
```

## Top-down Parsing

- Grammars for top-down parsing
- Implementing a top-down parser (recursive descent parser)

## Parsing Top-down

$$S \rightarrow E + S \mid E$$

$$E \rightarrow \text{num} \mid ( S )$$

**Goal:** construct a leftmost derivation of string while reading in token stream

Partly-derived String	Lookahead	parsed part	unparsed part
<b>S</b>	(	(1+2+(3+4))+5	
→ <b>E</b> +S		(1+2+(3+4))+5	
→ ( <b>S</b> )+S	1	(1+2+(3+4))+5	
→ ( <b>E</b> +S)+S	1	(1+2+(3+4))+5	
→ (1+ <b>S</b> )+S	2	(1+2+(3+4))+5	
→ (1+ <b>E</b> +S)+S	2	(1+2+(3+4))+5	
→ (1+2+ <b>S</b> )+S	2	(1+2+(3+4))+5	
→ (1+2+ <b>E</b> )+S	(	(1+2+(3+4))+5	
→ (1+2+( <b>S</b> ))+S	3	(1+2+(3+4))+5	
→ (1+2+( <b>E</b> +S))+S	3	(1+2+(3+4))+5	

## Problem

$$S \rightarrow E + S \mid E$$

$$E \rightarrow \text{num} \mid ( S )$$

- Want to decide which production to apply based on next symbol

(1)  $S \rightarrow E \rightarrow (S) \rightarrow (E) \rightarrow (1)$   
 (1)+2  $S \rightarrow E + S \rightarrow (S) + S \rightarrow (E) + S$   
 $\rightarrow (1)+E \rightarrow (1)+2$

- Why is this hard?

## Grammar is Problem

- This grammar cannot be parsed top-down with only a single look-ahead symbol
- Not **LL(1)** = Left-to-right-scanning, Left-most derivation, **1** look-ahead symbol
- Is it LL(k) for some k?
- Can rewrite grammar to allow top-down parsing: create LL(1) grammar for same language

## Making a grammar LL(1)

$$S \rightarrow E + S$$

$$S \rightarrow E$$

$$E \rightarrow \text{num}$$

$$E \rightarrow ( S )$$

$$S \rightarrow ES'$$

$$S' \rightarrow \epsilon$$

$$S' \rightarrow + S$$

$$E \rightarrow \text{num}$$

$$E \rightarrow ( S )$$

- Problem: can't decide which S production to apply until we see symbol after first expression
- **Left-factoring:** Factor common S prefix, add new non-terminal S' at decision point. S' derives (+E)\*
- Also: convert left-recursion to right-recursion

## Parsing with new grammar

$S \rightarrow ES'$      $S' \rightarrow \epsilon \mid +S$      $E \rightarrow \text{num} \mid (S)$

<b>S</b>	(	(1+2+(3+4))+5
$\rightarrow ES'$	(	(1+2+(3+4))+5
$\rightarrow (S)S'$	1	(1+2+(3+4))+5
$\rightarrow (ES')S'$	1	(1+2+(3+4))+5
$\rightarrow (1S')S'$	+	(1+2+(3+4))+5
$\rightarrow (1+ES')S'$	2	(1+2+(3+4))+5
$\rightarrow (1+2S')S'$	+	(1+2+(3+4))+5
$\rightarrow (1+2+S)S'$	(	(1+2+(3+4))+5
$\rightarrow (1+2+ES')S'$	(	(1+2+(3+4))+5
$\rightarrow (1+2+(S)S')S'$	3	(1+2+(3+4))+5
$\rightarrow (1+2+(ES')S')S'$	3	(1+2+(3+4))+5
$\rightarrow (1+2+(3S')S')S'$	+	(1+2+(3+4))+5
$\rightarrow (1+2+(3+ES')S')S'$	4	(1+2+(3+4))+5

Introduction to Compilers

13

## Predictive Parsing

### • LL(1) grammar:

- for a given non-terminal, the look-ahead symbol uniquely determines the production to apply
- top-down parsing = predictive parsing
- Driven by predictive parsing table of non-terminals  $\times$  terminals  $\rightarrow$  productions

CS 412/413 Spring 2004

Introduction to Compilers

14

## Using Table

$S \rightarrow ES'$   
 $S' \rightarrow \epsilon \mid +S$   
 $E \rightarrow \text{num} \mid (S)$

<b>S</b>	(	(1+2+(3+4))+5
$\rightarrow ES'$	(	(1+2+(3+4))+5
$\rightarrow (S)S'$	1	(1+2+(3+4))+5
$\rightarrow (ES')S'$	1	(1+2+(3+4))+5
$\rightarrow (1S')S'$	+	(1+2+(3+4))+5
$\rightarrow (1+S)S'$	2	(1+2+(3+4))+5
$\rightarrow (1+ES')S'$	2	(1+2+(3+4))+5
$\rightarrow (1+2S')S'$	+	(1+2+(3+4))+5

	num	+	(	)	\$
S	$\rightarrow ES'$		$\rightarrow ES'$		
S'		$\rightarrow +S$		$\rightarrow \epsilon$	$\rightarrow \epsilon$
E	$\rightarrow \text{num}$		$\rightarrow (S)$		

CS 412/413 Spring 2004

Introduction to Compilers

15

## How to Implement?

- Table can be converted easily into a recursive-descent parser

	num	+	(	)	\$
S	$\rightarrow ES'$		$\rightarrow ES'$		
S'		$\rightarrow +S$		$\rightarrow \epsilon$	$\rightarrow \epsilon$
E	$\rightarrow \text{num}$		$\rightarrow (S)$		

- Three procedures: parse\_S, parse\_S', parse\_E

CS 412/413 Spring 2004

Introduction to Compilers

16

## Recursive-Descent Parser

```
void parse_S() {
    lookahead token
    switch (token) {
        case num: parse_E(); parse_S'(); return;
        case '(': parse_E(); parse_S'(); return;
        default: throw new ParseError();
    }
}
```

	number	+	(	)	\$
$\rightarrow S$	$\rightarrow ES'$		$\rightarrow ES'$		
S'		$\rightarrow +S$		$\rightarrow \epsilon$	$\rightarrow \epsilon$
E	$\rightarrow \text{number}$		$\rightarrow (S)$		

CS 412/413 Spring 2004

Introduction to Compilers

17

## Recursive-Descent Parser

```
void parse_S'() {
    switch (token) {
        case '+': token = input.read(); parse_S(); return;
        case ')': return;
        case EOF: return;
        default: throw new ParseError();
    }
}
```

	number	+	(	)	\$
S	$\rightarrow ES'$		$\rightarrow ES'$		
$\rightarrow S'$		$\rightarrow +S$		$\rightarrow \epsilon$	$\rightarrow \epsilon$
E	$\rightarrow \text{number}$		$\rightarrow (S)$		

CS 412/413 Spring 2004

Introduction to Compilers

18

## Recursive-Descent Parser

```
void parse_E() {
    switch (token) {
        case number: token = input.read(); return;
        case '(': token = input.read(); parse_S();
                    if (token != ')') throw new ParseError();
                    token = input.read(); return;
        default: throw new ParseError(); }
}
```

	number	+	(	)	\$
S	→ ES'		→ ES'		→ ε
S'		→ +S		→ ε	→ ε
→ E	→ number		→ ( S )

19

## Call Tree = Parse Tree

CS 412/413 Spring 2004

Introduction to Compilers

20

## How to Construct Parsing Tables

- Needed: algorithm for automatically generating a predictive parse table from a grammar

S	→ ES'				
S'	→ ε   +S				
E	→ number   ( S )				

?

	N	+	(	)	\$
S	ES'		ES'		
S'		+S			
E	N		( S )		ε ε

CS 412/413 Spring 2004

Introduction to Compilers

21

## Constructing Parse Tables

- Can construct predictive parser if:
  - For every non-terminal, every look-ahead symbol can be handled by at most one production
- $FIRST(\gamma)$  for arbitrary string of terminals and non-terminals  $\gamma$  is:
  - set of symbols that might begin the fully expanded version of  $\gamma$
- $FOLLOW(X)$  for a non-terminal  $X$  is:
  - set of symbols that might follow the derivation of  $X$  in the input stream

CS 412/413 Spring 2004

Introduction to Compilers

22

## Parse Table Entries

- Consider a production  $X \rightarrow \gamma$
- Add  $\rightarrow \gamma$  to the  $X$  row for each symbol in  $FIRST(\gamma)$

	num	+	(	)	\$
S	→ ES'		→ ES'		
S'		→ +S			
E	→ num		→ ( S )		→ ε → ε

- If  $\gamma$  can derive  $\epsilon$  ( $\gamma$  is nullable), add  $\rightarrow \gamma$  for each symbol in  $FOLLOW(X)$
- Grammar is LL(1) if no conflicting entries

CS 412/413 Spring 2004

Introduction to Compilers

23

## Computing nullable, FIRST

- $X$  is nullable if it can derive the empty string:
  - if it derives  $\epsilon$  directly ( $X \rightarrow \epsilon$ )
  - if it has a production  $X \rightarrow YZ\dots$  where all RHS symbols ( $Y, Z$ ) are nullable
  - Algorithm: assume all non-terminals non-nullable, apply rules repeatedly until no change
- Determining  $FIRST(\gamma)$ 
  - $FIRST(X) \supseteq FIRST(\gamma)$  if  $X \rightarrow \gamma$
  - $FIRST(a\beta) = \{a\}$
  - $FIRST(X\beta) \supseteq FIRST(X)$
  - $FIRST(X\beta) \supseteq FIRST(\beta)$  if  $X$  is nullable
  - Algorithm: Assume  $FIRST(\gamma) = \{\}$  for all  $\gamma$ , apply rules repeatedly to build FIRST sets.

CS 412/413 Spring 2004

Introduction to Compilers

24

## Computing FOLLOW

- Compute FOLLOW(X):
  - FOLLOW(S)  $\supseteq$  { \$ }
  - If  $X \rightarrow \alpha Y \beta$ , FOLLOW(Y)  $\supseteq$  FIRST( $\beta$ )
  - If  $X \rightarrow \alpha Y \beta$  and  $\beta$  is nullable (or non-existent), FOLLOW(Y)  $\supseteq$  FOLLOW(X)
- Algorithm: Assume FOLLOW(X) = { } for all X, apply rules repeatedly to build FOLLOW sets
- Common theme: iterative analysis. Start with initial assignment, apply rules until no change

CS 412/413 Spring 2004

Introduction to Compilers

25

## Example

- nullable
  - only  $S'$  is nullable
- FIRST
  - FIRST( $E S'$ ) = { num, ( }
  - FIRST(+S) = { + }
  - FIRST(num) = { num }
  - FIRST( (S) ) = { ( }, FIRST( $S'$ ) = { + }
- FOLLOW
  - FOLLOW(S) = { \$, ) }
  - FOLLOW( $S'$ ) = { \$, ) }
  - FOLLOW(E) = { +, ), \$ }

$$\begin{array}{l} S \rightarrow E S' \\ S' \rightarrow \epsilon \mid + S \\ E \rightarrow \text{num} \mid ( S ) \end{array}$$

	num	+	(	)	\$
S					
S'					
E					

CS 412/413 Spring 2004

Introduction to Compilers

26

## Ambiguous grammars

- Construction of predictive parse table for ambiguous grammar results in conflicts

$$S \rightarrow S + S \mid S * S \mid \text{num}$$

FIRST(S + S) = FIRST(S \* S) = FIRST(num) = { num }

	num	+	*
S	→num, →S + S, →S * S		

CS 412/413 Spring 2004

Introduction to Compilers

27

## Summary

- LL(k) grammars
  - left-to-right scanning
  - leftmost derivation
  - can determine what production to apply from the next k symbols
  - Can automatically build predictive parsing tables
- Predictive parsers
  - Can be easily built for LL(k) grammars from the parsing tables
  - Also called recursive-descent, or top-down parsers
