Last Class: Parsing

- 1. Grammars and parsing
- 2. Top-down and bottom-up parsing
- 3. A top-down parser

Today: Parsing

- 1. Bottom-up chart parsing
- 2. Earley algorithm

Slide CS674-1

Algorithm for a Top-Down Parser

$PSL \leftarrow (((S) \ 1))$

- 1. Check for failure. If PSL is empty, return NO.
- 2. Select the current state, $C. C \leftarrow pop (PSL)$.
- 3. Check for success. If C = (() < final-position), YES.
- $4. \ \ Otherwise, \ generate \ the \ next \ possible \ states.$
 - (a) $s_1 \leftarrow \text{first-symbol}(C)$
 - (b) If s_1 is a *lexical symbol* and next word can be in that class, create new state by removing s_1 , updating the word position, and adding it to PSL.
 - (c) If s_1 is a non-terminal, generate a new state for each rule in the grammar that can rewrite s_1 . Add all to PSL.

General Parsing Strategies

Grammar	Top-Down	Bottom-Up
1. $S \rightarrow NP VP$	$S \rightarrow NP VP$	\rightarrow NAME ate the cat
2. $VP \rightarrow V NP$	\rightarrow NAME VP	\rightarrow NAME V the cat
3. NP \rightarrow NAME	\rightarrow Beav VP	\rightarrow NAME V ART cat
4. NP \rightarrow ART N	\rightarrow Beav V NP	\rightarrow NAME V ART N
5. NAME \rightarrow Beavis	\rightarrow Beav ate NP	\rightarrow NP V ART N
6. $V \rightarrow ate$	\rightarrow Beav ate ART N	\rightarrow NP V NP
7. ART \rightarrow the	\rightarrow Beav ate the N	\rightarrow NP VP
8. $N \rightarrow cat$	\rightarrow Beav ate the cat	\rightarrow S

Problems with the Top-Down Parser

- 1. Only judges grammaticality.
- 2. Stops when it finds a single derivation.
- 3. No semantic knowledge employed.
- 4. No way to rank the derivations.
- 5. Problems with left-recursive rules.
- $6.\ \,$ Problems with ungrammatical sentences.
- 7. Terribly inefficient!!

Have the first year Phd students in the computer science department take the Q-exam.

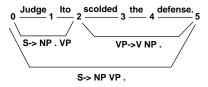

Have the first year Phd students in the computer science department taken the Q-exam?

Slide CS674-3

Chart Parsers

chart: data structure that stores partial results of the parsing process in such a way that they can be reused. The chart for an *n*-word sentence consists of:

- n+1 vertices
- a number of **edges** that connect vertices

Slide CS674-5

Bottom-UP Chart Parsing Algorithm

Do until there is no input left:

- 1. If the agenda is empty, get next word from the input, look up word categories, add to agenda (as constituent spanning two postions).
- 2. Select a constituent from the agenda: constituent C from p_1 to p_2 .
- 3. Insert C into the chart from position p_1 to p_2 .
- 4. For each rule in the grammar of form $X \to C X_1 \dots X_n$, add an active edge of form $X \to C \circ X_1 \dots X_n$ from p_1 to p_2 .

Chart Parsing: The General Idea

The process of parsing an n-word sentence consists of forming a chart with n + 1 vertices and adding edges to the chart one at a time.

- Goal: To produce a complete edge that spans from vertex 0 to n and is of category S.
- There is no backtracking.
- Everything that is put in the chart stays there.
- Chart contains all information needed to create parse tree.

Slide CS674-6

- 5. Extend existing edges that are looking for a C.
- (a) For any active edge of form $X \to X_1 \dots \circ CX_n$ from p_0 to p_1 , add a new active edge $X \to X_1 \dots C \circ X_n$ from p_0 to p_2 .
- (b) For any active edge of form $X \to X_1 \dots X_n \circ C$ from p_0 to p_1 , add a new (completed) constituent of type X from p_0 to p_2 to the agenda.

Slide CS674-7

Grammar and Lexicon

Grammar:

1. $S \rightarrow NP VP$

3. NP \rightarrow ART ADJ N

2. NP \rightarrow ART N

4. $VP \rightarrow V NP$

Lexicon:

the: ART

man: N, V

old: ADJ, N

boat: N

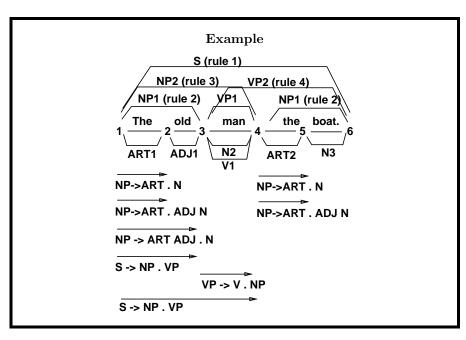

Sentence: $_1$ The $_2$ old $_3$ man $_4$ the $_5$ boat $_6$

Slide CS674-9

Bottom-up Chart Parser

Is it any less naive than the top-down parser?

- 1. Only judges grammaticality.[fixed]
- 2. Stops when it finds a single derivation.[fixed]
- 3. No semantic knowledge employed.
- 4. No way to rank the derivations.
- 5. Problems with ungrammatical sentences.[better]
- 6. Terribly inefficient[???]

Slide CS674-10

Efficient Parsing

n = sentence length

Time complexity for naive algorithm: exponential in nTime complexity for bottom-up chart parser: $\bigcirc(n^3)$

Options for improving efficiency:

- 1. Don't do twice what you can do once.
- 2. Don't represent distinctions that you don't need.

Fall leaves fall and spring leaves spring.

3. Don't do once what you can avoid altogether.

The can holds the water. ("can": AUX, V, N)

Top-Down Chart Parser

For all S rules of the form $S \to X_1 \dots X_k$, add a (top-down) edge from 1 to 1 labeled: $S \to \circ X_1 \dots X_k$.

Do until there is no input left:

- 1. If the agenda is empty, look up word categories for next word, add to agenda.
- 2. Select a constituent from the agenda: constituent C from p_1 to p_2 .
- 3. Using the (bottom-up) edge extension algorithm, combine C with every active edge on the chart (adding C to chart as well). Add any new constituents to the agenda.
- 4. For any active edges created in Step 3, add them to the chart using the top-down edge introduction algorithm.

Slide CS674-13

Grammar and Lexicon

Grammar Lexicon

1. $S \rightarrow NP VP$ the: ART

2. NP \rightarrow ART ADJ N large: ADJ

3. $NP \rightarrow ART N$ can: N, AUX, V

4. $NP \rightarrow ADJ N$ hold: N, V

5. $VP \rightarrow AUX VP$ water: N, V

6. $VP \rightarrow V NP$

Sentence: $_1$ The $_2$ large $_3$ can $_4$ can $_5$ hold $_6$ water $_7$

Slide CS674-15

Top-down edge introduction.

To add an edge $S \to C_1 \dots \circ C_i \dots C_n$ ending at position j: For each rule in the grammar of form $C_i \to X_1 \dots X_k$, recursively add the new edge $C_i \to \circ X_1 \dots X_k$ from j to j.
